

## Preparing the Ground for Your New Harmony<sup>®</sup> Sod

### Prepare the area by clearing it of any existing weeds or grass.

- This will minimize problems in the future with weed control.
- The most common way to clear the area is by applying a broad-spectrum herbicide.

### Remove sticks, stones, roots, debris, and large clods.

### Locate and flag sprinkler heads.

This will minimize damage or delays when cutting out the sod.

### Work, level, and smooth the area with a rake

Make sure the grade is ½ inch below driveways, walkways, and borders; and 1 inch below sprinkler heads.

### Pre-irrigate the surface

Water the evening before installation. It is essential that sod is not installed on a dry surface.
